Chapter 1

Host Javascript API

1.1 Overview

The host javascript API allows users to integrate with the Solid State Networks host platform.

The usage of this API is restricted to entities which have signed a license agreement with Solid State Networks, Inc.

Licenses are valid for only one PRODUCT usage. Please see the license agreement for further details.

Chapter 2

Class Index

2.1 Class List

Here are the classes, structs, i	unions and interfaces	with brief descriptions
----------------------------------	-----------------------	-------------------------

App (Solid State's Application Interface)	7
Array (Array extension)	13
BundleLoader (Helper class to load bundles from JSON file) 1	14
Host (Host Top level container for the host)	15
HttpDownload (HTTP downloader)	19
SkinWindow (Solid State's HTML Skinned Window)	23

4 Class Index

Chapter 3

File Index

3.1 File List

Here is a list of all documented files with brief descriptions:

app.js (File containing App class and creation function)	29
bundleloader.js (File containing BundleLoader class and creation function)	29
host.js (File containing Host class)	30
httpdownload.js (File containing HttpDownload class and creation function)	31
skinwindow.js (File containing SkinWindow class and creation function)	31

6 File Index

Chapter 4

Class Documentation

4.1 App Class Reference

Solid State's Application Interface.

Public Member Functions

- void attachBundle (string bundleName, string path)
- bool authorizeUrl (string url)
- void error (string message)
- string expandString (string expand)
- string getCommandLine ()
- string getConfig (string key, string defaultValue)
- bool getElevated ()
- bool getImplode ()
- bool getRemoveLocalStorage ()
- bool getRestart ()
- bool getRestartElevated ()
- bool hasBundle (string bundleName)
- void info (string message)
- void loadInterop (string fileName)
- void release ()
- void setCommandLine (string value)
- void setConfig (string key, string value)
- void setImplode (bool value)
- void setRemoveLocalStorage (bool value)
- void setRestart (bool value)
- void setRestartElevated (bool value)
- void warn (string message)

Public Attributes

- · string instanceId
- · event onBundleAttached
- event onInteropLoaded
- event onWillConstructWebGetTarget
- event onWillRestart

4.1.1 Detailed Description

Solid State's Application Interface.

4.1.2 Member Function Documentation

4.1.2.1 void App.attachBundle (string bundleName, string path)

This method attaches a bundle.

Parameters

bundleName	Name of bundle to be checked.
path	Local location of the bundle.

4.1.2.2 bool App.authorizeUrl (string url)

This method checks if a url is in the app config whitelist.

Parameters

url	Url to be checked.

Returns

true if authorized, false otherwise.

4.1.2.3 void App.error (string message)

Adds an error line to the host log file.

message	string to add to the log file.

4.1.2.4 string App.expandString (string expand)

This method expands the string with the current macros.

Parameters

```
expand Name of string to be expanded.
```

Returns

expanded string.

4.1.2.5 string App.getCommandLine ()

gets the application command line

Returns

application command line

4.1.2.6 string App.getConfig (string key, string defaultValue)

This method retrieves a config setting.

Parameters

	key	Name of config setting to be retrieved.
defaultVa	alue	Default value of key if nothing is found.

Returns

value of key's setting.

4.1.2.7 bool App.getElevated ()

gets the host's current elevation status

Returns

host's current elevation status

4.1.2.8 bool App.getImplode ()

gets the self delete on exit

Returns

self delete on exit

4.1.2.9 bool App.getRemoveLocalStorage ()

gets the flag value to remove the local storage directory on shutdown

Returns

flag value to remove the local storage directory on shutdown

4.1.2.10 bool App.getRestart ()

gets the flag value to restart the host

Returns

flag value to restart the host

4.1.2.11 bool App.getRestartElevated ()

gets the flag value to elevate the restart

Returns

flag value to elevate the restart

4.1.2.12 bool App.hasBundle (string bundleName)

This method checks if a bundle name has already been attached.

Parameters

|--|--|

Returns

true if attached, false otherwise.

4.1.2.13 void App.info (string message)

Adds an information line to the host log file.

Parameters

message string to add to the log file.

4.1.2.14 void App.loadInterop (string fileName)

This method loads an interop library.

Parameters

fileName	Name of interop library to be loaded.

4.1.2.15 void App.release ()

releases the object

4.1.2.16 void App.setCommandLine (string value)

sets the application command line

Parameters

value	application command line
-------	--------------------------

4.1.2.17 void App.setConfig (string key, string value)

This method sets a config setting.

Parameters

key	Name of config setting to be retrieved.
value	Value store in key parameter.

4.1.2.18 void App.setImplode (bool value)

sets the self delete on exit

Parameters

value	self delete on exit

4.1.2.19 void App.setRemoveLocalStorage (bool value)

sets the flag value to remove the local storage directory on shutdown

value flag value to remove the local storage directory on shutdown				
	val	flag value to i	remove the local storage directory on	shutdown

4.1.2.20 void App.setRestart (bool value)

sets the flag value to restart the host

Parameters

value	flag value to restart the host

4.1.2.21 void App.setRestartElevated (bool value)

sets the flag value to elevate the restart

Parameters

value flag value to elevate the restart

4.1.2.22 void App.warn (string message)

Adds a warning line to the host log file.

Parameters

message	string to add to the log file.

4.1.3 Member Data Documentation

4.1.3.1 string App.instanceId

Instance id used to bind proxy object to native object

4.1.3.2 event App.onBundleAttached

Triggered when a bundle is attached.

Parameters

bundleName	name of the bundle to attach.
path	path of the bundle to attach.
successful	true if the attach was successful, false otherwise.

4.1.3.3 event App.onInteropLoaded

Triggered when an interop library is loaded.

fileName	file name of the interop library.
	·

successful true if the load was successful, false otherwise.

4.1.3.4 event App.onWillConstructWebGetTarget

This event is triggered whenever a http get is attempted.

Parameters

url url for the http get.

Returns

string: new url for the http get.

4.1.3.5 event App.onWillRestart

Triggered when an restart is required.

The documentation for this class was generated from the following file:

• app.js

4.2 Array Class Reference

Array extension.

Public Member Functions

- int indexOf (void elt)
- void removeElement (void element)
- void removeIndex (int index)

4.2.1 Detailed Description

Array extension.

4.2.2 Member Function Documentation

4.2.2.1 int Array.indexOf (void elt)

gets the index of an object

object	object to get the array index of
from	optional starting point

Returns

index of object in array

4.2.2.2 void Array.removeElement (void element)

removes an object

Parameters

obiect	object to remove

4.2.2.3 void Array.removeIndex (int index)

removes an object at the given index

Parameters

index	index of object
maox	mack of object

The documentation for this class was generated from the following file:

• jshelper.js

4.3 BundleLoader Class Reference

Helper class to load bundles from JSON file.

Public Member Functions

• void start ()

Public Attributes

- string name
- event onComplete
- event onProgress
- string url

4.3.1 Detailed Description

Helper class to load bundles from JSON file.

4.3.2 Member Function Documentation

4.3.2.1 void BundleLoader.start ()

starts the bundle loader

4.3.3 Member Data Documentation

4.3.3.1 string BundleLoader.name

Name of the bundle in the {LocalStorage} directory

4.3.3.2 event BundleLoader.onComplete

Triggered when the bundle loader is complete.

Parameters

successful true if the download was successful, false otherwise.

4.3.3.3 event BundleLoader.onProgress

Triggered when the bundle loader has made progress.

Parameters

percent (-1.0: Still calculating) (0.0 to 1.0: Percent completed)

4.3.3.4 string BundleLoader.url

Url location of the bundle

The documentation for this class was generated from the following file:

• bundleloader.js

4.4 Host Class Reference

Host Top level container for the host.

Public Member Functions

- void addBundleAttachedEventHandler (event handler)
- void addInteropLoadedEventHandler (event handler)
- void elevate ()
- void getJSON (string url, event completeCallback)
- string idFromString (string str)
- void init (void skinWindow)
- void loadBundles (string url, event statusCallback, event progressCallback, event completeCallback)
- void loadJS (string url, event completeCallback)
- void loadJSArray (array urls, event completeCallback)
- void release (*)
- void removeBundleAttachedEventHandler (event handler)
- void removeInteropLoadedEventHandler (event handler)
- string urlToFileName (string url, string directory, string extension)

Public Attributes

- app app
- SkinWindow skinWindow

4.4.1 Detailed Description

Host Top level container for the host.

4.4.2 Member Function Documentation

4.4.2.1 void Host.addBundleAttachedEventHandler (event handler)

subscribe to the BundleAttached event

Parameters

handler	callback function for BundleAttached event

4.4.2.2 void Host.addInteropLoadedEventHandler (event handler)

subscribe to the InteropLoaded event

handler callback function for InteropLoaded event		
	handle	callback function for InteropLoaded event

4.4.2.3 void Host.elevate ()

elevates the host

4.4.2.4 void Host.getJSON (string url, event completeCallback)

gets a JSON object from a url

Parameters

url	url of json object
complete-	called when function is complete with json object as parameter
Callback	

4.4.2.5 string Host.idFromString (string str)

creates an id from a string

Parameters

str string to create id from	
------------------------------	--

Returns

id created from string

4.4.2.6 void Host.init (void skinWindow)

initializes the host

4.4.2.7 void Host.loadBundles (string url, event statusCallback, event progressCallback, event completeCallback)

load bundles from url containing json file

url	url of json object containing bundle information
statusCall-	called when function changes status with name and state parameters
back	
progress-	called when function changes progress with percent parameter
Callback	
complete-	called when function is complete with successful parameter
Callback	

4.4.2.8 void Host.loadJS (string url, event completeCallback)

dynamically load javascript files from url

Parameters

url	url of javascript
complete-	called when function is complete with successful parameter
Callback	

4.4.2.9 void Host.loadJSArray (array urls, event completeCallback)

dynamically load javascript files from url

Parameters

urls	array of urls for javascript files
complete-	called when function is complete with successful parameter
Callback	

4.4.2.10 void Host.release ()

releases the host

4.4.2.11 void Host.removeBundleAttachedEventHandler (event handler)

unsubscribe from the BundleAttached event

Parameters

handler	callback function for BundleAttached event

4.4.2.12 void Host.removeInteropLoadedEventHandler (event handler)

unsubscribe from the InteropLoaded event

Parameters

handler	callback function for InteropLoaded event

4.4.2.13 string Host.urlToFileName (string url, string directory, string extension)

converts a url to a filename in the specified directory

Parameters

url	url to convert
directory	output directory
extension	extension of filename

Returns

path to file

4.4.3 Member Data Documentation

4.4.3.1 app Host.app

App attached to host

4.4.3.2 SkinWindow Host.skinWindow

Window attached to host

The documentation for this class was generated from the following file:

host.js

4.5 HttpDownload Class Reference

HTTP downloader.

Public Member Functions

- int getExitCode ()
- string getFileName ()
- string getUrl ()
- bool getUseCache ()
- bool getUseWriteCallback ()
- void release ()
- void setFileName (string value)
- void setUrl (string value)
- void setUseCache (bool value)
- void setUseWriteCallback (bool value)
- void start ()

Public Attributes

- · string instanceId
- event onComplete
- · event onDownloadRequired
- event onProgress
- event onStart
- event onWrite

4.5.1 Detailed Description

HTTP downloader.

4.5.2 Member Function Documentation

```
4.5.2.1 int HttpDownload.getExitCode ( )
```

gets the exit code for download

Returns

Exit code for download

```
4.5.2.2 string HttpDownload.getFileName ( )
```

gets the file name where url is saved

Returns

File name where url is saved

```
4.5.2.3 string HttpDownload.getUrl ( )
```

gets the url to download

Returns

Url to download

4.5.2.4 bool HttpDownload.getUseCache ()

gets the determines if caching is used in the http request

Returns

Determines if caching is used in the http request

4.5.2.5 bool HttpDownload.getUseWriteCallback ()

gets the determines if the write callback is used in the http request

Returns

Determines if the write callback is used in the http request

4.5.2.6 void HttpDownload.release ()

releases the object

4.5.2.7 void HttpDownload.setFileName (string value)

sets the file name where url is saved

Parameters

value File name where url is saved

4.5.2.8 void HttpDownload.setUrl (string value)

sets the url to download

Parameters

value Url to download

4.5.2.9 void HttpDownload.setUseCache (bool value)

sets the determines if caching is used in the http request

Parameters

value Determines if caching is used in the http request

4.5.2.10 void HttpDownload.setUseWriteCallback (bool value)

sets the determines if the write callback is used in the http request

Parameters

value Determines if the write callback is used in the http request

4.5.2.11 void HttpDownload.start ()

Start downloading

4.5.3 Member Data Documentation

4.5.3.1 string HttpDownload.instanceld

Instance id used to bind proxy object to native object

4.5.3.2 event HttpDownload.onComplete

Triggered when download is complete.

Parameters

successful true if the download was successful, false otherwise.

4.5.3.3 event HttpDownload.onDownloadRequired

Triggered when an actual download is required.

4.5.3.4 event HttpDownload.onProgress

Triggered when download has made progress.

Parameters

percent (-1.0: Still calculating) (0.0 to 1.0: Percent completed)

4.5.3.5 event HttpDownload.onStart

Triggered when download is started.

4.5.3.6 event HttpDownload.onWrite

Triggered when a write is required.

Parameters

buffer Hex converted buffer for the download.

Returns

bool: true to continue download, false to cancel

The documentation for this class was generated from the following file:

· httpdownload.js

4.6 SkinWindow Class Reference

Solid State's HTML Skinned Window.

Public Member Functions

- bool beginMove ()
- bool beginSize ()
- bool close ()
- int getHeight ()
- int getWidth ()
- int getX ()
- int getY ()
- bool hide ()
- bool load (string windowConfigUrl)
- bool minimize ()
- void release ()
- bool restore ()
- bool setOrigin (int x, int y)
- bool setSize (int width, int height)
- void setTitle (string title)
- bool show ()

Public Attributes

- · string instanceld
- event onDidClose
- event onWillClose

4.6.1 Detailed Description

Solid State's HTML Skinned Window.

4.6.2 Member Function Documentation

4.6.2.1 bool SkinWindow.beginMove ()

This method informs the native window of any movement so that the native/browser windows can be synchronized.

Returns

true upon success, false upon failure.

```
4.6.2.2 bool SkinWindow.beginSize ( )
```

This method informs the native window of any movement so that the native/browser windows can be synchronized.

Returns

true upon success, false upon failure.

```
4.6.2.3 bool SkinWindow.close ( )
```

This method will exit the launcher application.

Returns

true upon success, false upon failure.

```
4.6.2.4 int SkinWindow.getHeight ( )
```

gets the height of the window.

Returns

Height of the window.

```
4.6.2.5 int SkinWindow.getWidth ( )
```

gets the width of the window.

Returns

Width of the window.

```
4.6.2.6 int SkinWindow.getX ( )
```

gets the x origin of the window.

Returns

X origin of the window.

```
4.6.2.7 int SkinWindow.getY ( )
```

gets the y origin of the window.

Returns

Y origin of the window.

```
4.6.2.8 bool SkinWindow.hide ( )
```

This method will hide the window.

Returns

true upon success, false upon failure.

4.6.2.9 bool SkinWindow.load (string windowConfigUrl)

This creates a loads a new window.

Parameters

windowCon-	URL to the window configuration file.
figUrl	

Returns

true upon success, false upon failure.

```
4.6.2.10 bool SkinWindow.minimize ( )
```

This method will minimize the launcher application.

Returns

true upon success, false upon failure.

```
4.6.2.11 void SkinWindow.release ( )
```

releases the object

4.6.2.12 bool SkinWindow.restore ()

This method will restore a minimized launcher application.

Returns

true upon success, false upon failure.

4.6.2.13 bool SkinWindow.setOrigin (int x, int y)

Set the origin of the launcher window

Parameters

X	The desired x value of the launcher window.
У	The desired y value of the launcher window.

Returns

true upon success, false upon failure.

4.6.2.14 bool SkinWindow.setSize (int width, int height)

Set the size of the launcher window

Parameters

width	The desired width of the launcher window.
height	The desired height of the launcher window.

Returns

true upon success, false upon failure.

4.6.2.15 void SkinWindow.setTitle (string title)

Set the title of the launcher window

Parameters

title The title of the launcher window.

4.6.2.16 bool SkinWindow.show ()

This method will show the window.

Returns

true upon success, false upon failure.

- 4.6.3 Member Data Documentation
- 4.6.3.1 string SkinWindow.instanceld

Instance id used to bind proxy object to native object

4.6.3.2 event SkinWindow.onDidClose

Triggered when the window is closed.

4.6.3.3 event SkinWindow.onWillClose

Triggered before the window is closed.

Returns

bool: true to allow the window to close, false otherwise.

The documentation for this class was generated from the following file:

• skinwindow.js

Chapter 5

File Documentation

5.1 app.js File Reference

File containing App class and creation function.

Classes

class App

Solid State's Application Interface.

Functions

• void createApp ()

5.1.1 Detailed Description

File containing App class and creation function.

5.1.2 Function Documentation

5.1.2.1 void createApp ()

Create instance of app

5.2 bundleloader.js File Reference

 $\label{eq:containing BundleLoader class} \ \text{and creation function}.$

Classes

• class BundleLoader

Helper class to load bundles from JSON file.

Functions

• void createBundleLoader ()

5.2.1 Detailed Description

File containing BundleLoader class and creation function.

5.2.2 Function Documentation

5.2.2.1 void createBundleLoader ()

Create instance of bundle loader

5.3 host.js File Reference

File containing Host class.

Classes

· class Host

Host Top level container for the host.

Variables

· Host host

5.3.1 Detailed Description

File containing Host class.

5.3.2 Variable Documentation

5.3.2.1 Host host

precreated global instance of the host

5.4 httpdownload.js File Reference

File containing HttpDownload class and creation function.

Classes

class HttpDownload

HTTP downloader.

Functions

• void createHttpDownload ()

5.4.1 Detailed Description

File containing HttpDownload class and creation function.

5.4.2 Function Documentation

5.4.2.1 void createHttpDownload ()

Create instance of httpDownload

5.5 skinwindow.js File Reference

File containing SkinWindow class and creation function.

Classes

• class SkinWindow

Solid State's HTML Skinned Window.

Functions

• void createSkinWindow ()

5.5.1 Detailed Description

File containing SkinWindow class and creation function.

- 5.5.2 Function Documentation
- 5.5.2.1 void createSkinWindow ()

Create instance of skinWindow
